FINAL INTERNSHIP REPORT

AI AUTOMATION

Submitted by	**Saira Iftikhar**
Organization	Logitrix Solutions
Internship start date	1 August 2026
Report submission date	8 November 2026
Internship track	AI Automation Intern

Table of Contents

1. 1. Executive Summary
2. 2. Introduction
3. 3. Internship Details and Objectives
4. 4. Tools and Technologies
5. 5. Work Performed and Assignments
6. 6. Detailed Project Workflow: Google Maps Lead Generation
7. 7. Skills and Knowledge Acquired
8. 8. Challenges and Learning
9. 9. Contributions and Outcomes
10. 10. Conclusion
11. 11. Recommendations
12. 12. Project Deliverables Checklist
13. 13. Repository and Appendix Information
14. 14. Declaration

1. Executive Summary

This report summarizes my internship experience at Logitrix Solutions, beginning on 1 August 2026. The internship provided practical exposure to AI automation, workflow design, prompt engineering, and the development of integrations using n8n and related tools.

During the internship, the intern worked on automation projects and learning tasks including a Weather Digest Bot, a WhatsApp Chat Support System, Telegram and Gmail message-handling workflows, and a Google Maps-based lead-generation workflow. Additional learning activities included creating custom Claude Skills and developing prompts for multiple AI assistants.

The report records the work and progress described by the intern. Where a project's final deployment or completion status was not confirmed in the information available, that status is identified for verification before submission.

2. Introduction

Artificial intelligence and workflow automation are increasingly used to streamline routine business processes, improve customer communication, and support lead generation. The internship at Logitrix Solutions offered an opportunity to explore these areas through practical assignments and guided project work.

The main focus of the internship was to understand how automation workflows are planned, built, tested, documented, and connected with external services. The work also developed foundational skills in prompt engineering and the use of AI tools.

3. Internship Details and Objectives

Organization: Logitrix Solutions

Intern: Saira Iftikhar

Internship start date: 1 August 2026

Submission date of this report: 8 November 2026

Position/track: AI Automation Intern

Supervisor/mentor: Sir Mohsin

Internship end date: 1st November 2026

Primary objectives included learning practical AI automation; building and understanding n8n workflows; connecting messaging and productivity services; improving prompt-writing skills; creating reusable Claude Skills; documenting technical work; and developing problem-solving and independent learning skills.

4. Tools and Technologies

n8n: Workflow automation platform used to create and connect workflow steps.

Python: Used during internship learning and practical work; the intern has described her Python level as intermediate.

Google Maps scraper: Used as a source for collecting business information for lead generation.

Google Sheets: Used as a destination for organizing and managing collected lead information.

WhatsApp integration: Used in customer-support and lead-follow-up automation workflows.

Gmail: Used in email-related automation and message handling.

Telegram: Used in messaging workflow practice.

Claude and other AI assistants: Used for prompt engineering and custom skill development.

APIs, webhooks, and triggers: Concepts explored while connecting services and initiating automation workflows. Specific implementation details should be checked against the submitted workflow files.

5. Work Performed and Assignments

5.1 Prompt Engineering

I have completed a prompt-generation assignment involving eight AI assistants: Gemini, Claude, Kimi, ChatGPT, Grok, Perplexity, DeepSeek, and Microsoft Copilot. The task focused on writing clear, structured prompts and understanding how prompt frameworks can guide model responses. Frameworks discussed during the assignment included TCREI, COSTAR, CRISP, RAISE, Chain-of-Thought, and Tree-of-Thought. The final submitted spreadsheet is attached as a supporting deliverable.

5.2 Claude Skills Development

I have created four custom Claude Skill files. Each skill was organized around its name, purpose, how it works, and benefits. This task provided experience in structuring reusable instructions and packaging task-specific guidance for an AI assistant. The four skill files should be included with the final project materials.

5.3 Weather Digest Bot

I have worked on a Weather Digest Bot using n8n. The workflow was intended to retrieve current-weather information and send regular weather notifications. This project introduced the use of triggers, connected workflow nodes, data handling, and automated message delivery. Below is the attachment of the final workflow JSON and representative execution screenshots.

5.4 WhatsApp Chat Support System

I have developed an n8n-based WhatsApp chat-support workflow for a software-company use case. The intended process received an incoming WhatsApp message, extracted relevant message details, processed the query through FAQ or AI-assisted logic, and generated a WhatsApp Business Cloud response. The workflow design also considered escalation of sensitive or unresolved queries to a human support representative. Google Sheets was considered for FAQ storage and ticket logging. I have reported completing this task. Below is attachment of the final workflow export, configuration notes, and screenshots,

5.5 Telegram and Gmail Automation

After working on the WhatsApp support task, I have practised similar message-handling automation with Telegram and Gmail. The work included extracting sender information, such as the sender's name, and handling incoming messages through workflow steps.Below is the attachment of the relevant workflow exports and screenshots.

5.6 Google Maps Lead Generation Automation

My final project work involved lead generation through Google Maps scraping. The workflow was designed to start on form submission, collect business information through a Google Maps scraper, and place the resulting leads into a sheet for organized review. The broader workflow also included planned or developed follow-up through WhatsApp messages and email. At the earlier documentation stage, scraping had been completed while the email and WhatsApp follow-up portion was completed later on. Below is the final attachment of the full final project with the final report.

6. Detailed Project Workflow: Google Maps Lead Generation

Objective: Reduce manual effort in finding and organizing potential business leads by automating the collection of publicly available business information.

Trigger: Form submission initiates the workflow.

Data collection: The workflow passes the submitted search criteria to the Google Maps scraping step where we use rapid api to fetch leads data(emails and whatsapp number)..

Lead organization: Scraped business records are transferred to a sheet so that the collected information can be reviewed and managed.

Follow-up stage: The wider workflow is intended to send follow-up messages through WhatsApp and email. The final report should distinguish clearly between steps that were fully tested and steps that remain in progress.

Expected benefits: Faster lead collection, consistent organization of prospect information, reduced repetitive manual work, and a foundation for structured outreach.

A complete detailed report is provided below with a json file and mp4 video.

7. Skills and Knowledge Acquired

Practical workflow creation and troubleshooting in n8n.

Understanding of triggers, webhooks, workflow nodes, data mapping, and integrations.

Basic design of automated customer-support and lead-generation processes.

Prompt engineering for multiple AI assistants and awareness of structured prompting frameworks.

Creation and organization of reusable Claude Skills.

Working with messaging and productivity services, including WhatsApp, Telegram, Gmail, and Google Sheets.

Python practice; I have reported an intermediate level and practical use during the internship.

Technical documentation, task organization, independent learning, and problem-solving.

8. Challenges and Learning

Building multi-step workflows required careful attention to the data passed between nodes and the configuration of connected services.

Integrations involving messaging platforms required understanding triggers, sender details, authentication, and message formats.

Automation tasks demonstrated the importance of testing each stage independently before running an end-to-end workflow.

Prompt engineering and custom skill development required clear instructions, suitable context, and iterative refinement.

These activities reinforced the value of documenting assumptions, recording errors, protecting credentials, and validating outputs before relying on automation.

9. Contributions and Outcomes

I contributed to practical automation exercises and project deliverables across weather notifications, customer support, messaging workflows, and lead generation.

I have completed a prompt-generation assignment and created four custom Claude Skills.

I reported completing the WhatsApp chat-support task and developed a Google Maps lead-generation workflow whose scraping component had been completed at the earlier reporting stage.

10. Conclusion

The internship at Logitrix Solutions provided valuable practical exposure to AI automation and workflow development. Through assignments involving n8n, messaging integrations, lead generation, prompt engineering, and Claude Skills, I have strengthened my understanding of how automation can support business processes.

The experience also highlighted the importance of testing, documentation, secure handling of credentials, and clear communication of project status. The skills and project experience gained during the internship provide a foundation for continued learning and further work in AI automation.

11. Recommendations

Continue practising n8n by building and testing workflows with realistic but non-sensitive sample data.

Maintain clear documentation for every workflow, including purpose, prerequisites, trigger, node sequence, expected output, error handling, and test results.

Use environment variables or approved credential storage rather than hard-coding API keys and tokens.

Add validation, duplicate handling, logging, and human review where appropriate in lead-generation and outreach workflows.

Keep GitHub repositories organized with a README, sanitized workflow exports, setup instructions, and screenshots where permitted.

12. Project Deliverables Checklist

Final internship report (this document), in PDF and editable Word formats.

Prompt Engineering assignment spreadsheet covering the eight AI assistants.

Four custom Claude Skill files.

Weather Digest Bot n8n workflow JSON and screenshots.

WhatsApp Chat Support System n8n workflow JSON, setup notes, and screenshots.

Telegram and Gmail automation workflow exports and screenshots.

Google Maps Lead Generation workflow JSON, documentation, and screenshots.

Any presentation, test evidence, or additional files requested by the mentor.

GitHub repository links.

13. Repository and Appendix Information

GitHub repository URL(s):

Repository 1: https://github.com/SairaIftikhar/AI-Automation-pro.git

Repository 2: https://github.com/SairaIftikhar/AI-Automation-pro.git

Project folder/location:
https://drive.google.com/drive/folders/1E1hGWu9IHhK05CtLFTuQmcgsT311JUMX?usp=sharing

Supervisor/mentor name: Sir Mohsin

Date of final project verification: 2 November 2026

Appendix A: Prompt Engineering spreadsheet.

Appendix B: Four Claude Skill files.

Appendix C: n8n workflow exports and screenshots.

Appendix D: Google Maps lead-generation documentation and test evidence.

14. Declaration

I confirm that this report is a summary of the internship activities and project work that I have undertaken or contributed to during my internship at Logitrix Solutions. I have reviewed the project descriptions and will ensure that the final submission accurately reflects the work completed and the status of each deliverable.
